

XC6201 Series

Positive Voltage Regulators

- ◆ CMOS Low Power Consumption
- ◆ Dropout Voltage : 0.16V @ 100mA,
0.40V @ 200mA
- ◆ Maximum Output Current : 250mA (V_{OUT}=5.0V, TYP)
- ◆ Highly Accurate : ±2%
- ◆ Output Voltage Range : 1.3V ~ 6.0V
- ◆ SOT-25 / SOT-89 / TO-92 / USP-6B Package
- ◆ Capacitors can be Tantalum or Ceramic

GENERAL DESCRIPTION

The XC6201 series are highly precise, low power consumption, positive voltage regulators manufactured using CMOS and laser trimming technologies.

The series provides large currents with a significantly small dropout voltage.

The XC6201 consists of a current limiter circuit, a driver transistor, a precision reference voltage and an error amplifier. Output voltage is selectable in 100mV steps between 1.3V ~ 6.0V. SOT-25 (250mW), SOT-89 (500mW), USP-6B (100mW) and TO-92 (300mW) packages are available.

APPLICATIONS

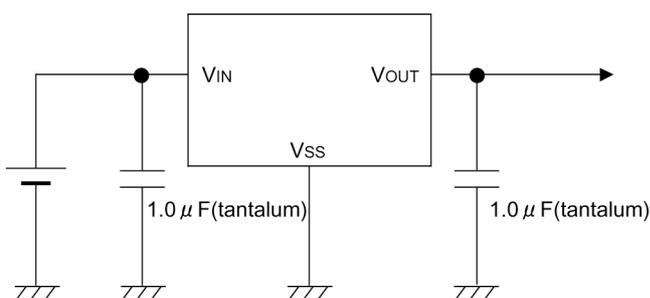

- Mobile Phones
- Cordless phones, Wireless communication equipment
- Cameras, video recorders
- Portable games
- Portable AV equipment
- Reference voltage
- Battery powered equipment

FEATURES

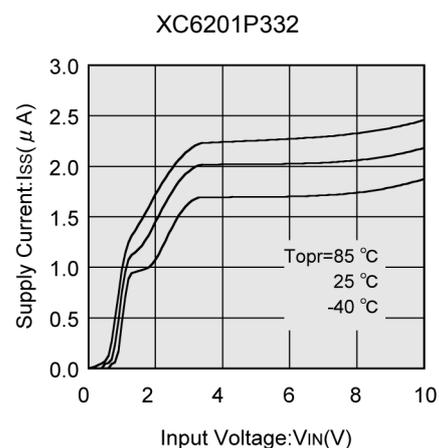

- Maximum Output Current** : 250mA (TYP.)
- Dropout Voltage** : 0.16V @ 100mA
- Maximum Operating Voltage** : 10V
- Output Voltage Range** : 1.3V ~ 6.0V
(selectable in 100mV steps)
- Highly Accurate** : ±2%
- Low Power Consumption** : 2.0 μA (TYP.)
- Operational Temperature Range** : -40°C ~ 85°C
- Ultra Small Packages** : SOT-25 (250mW),
SOT-89 (500mW),
TO-92 (300mW),
USP-6B (100mW)

Tantalum or Ceramic Capacitor compatible

*The dissipation pad for the USP-6B package should be solder-plated in recommended mount pattern and metal masking so as to enhance mounting strength and heat release. If the pad needs to be connected to other pins, it should be connected to the VSS pin.

NOTE:

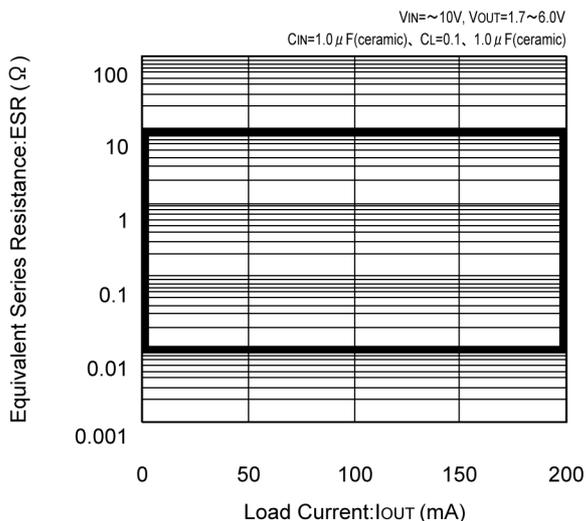

- *1: $V_{OUT(T)}$ = Specified output voltage.
- *2: $V_{OUT(E)}$ = Effective output voltage (i.e. the output voltage when " $V_{OUT(T)}+1.0V$ " is provided while maintaining a certain I_{OUT} value).
- *3: $V_{dif} = \{ V_{IN1}^{(*5)} - V_{OUT1}^{(*4)} \}$
- *4: V_{OUT1} = A voltage equal to 98% of the output voltage when a stabilized ($V_{OUT(T)} + 1.0V$) is input.
- *5: V_{IN1} = The input voltage at the time V_{OUT1} is output input voltage has been gradually reduced.

TYPICAL APPLICATION CIRCUIT

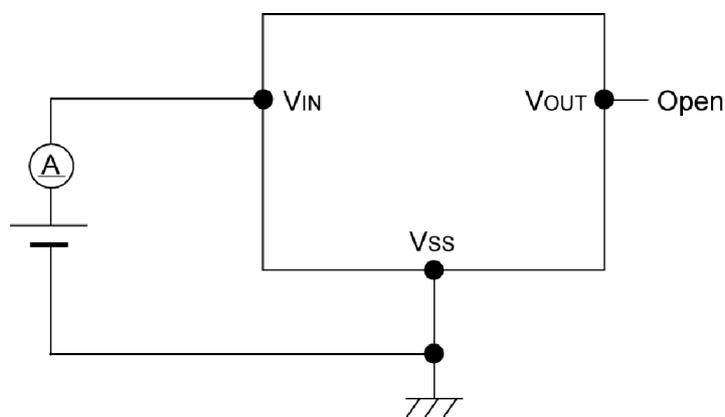

With the XC6201 series regulator, in order to ensure the stabilized output voltage, we suggest that an output capacitor (CL) of $1\ \mu\text{F}$ or more be connected between the output pin (VOUT) and the VSS pin. For using low ESR capacitor (e.g. ceramic capacitors), please make sure that the output voltage is more than 1.7V. When the output voltage is from 1.3V to 1.6V, the output capacitor should be a tantalum capacitor with a capacitance of $2.2\ \mu\text{F}$. We also suggest an input capacitor (CIN) should be connected between the VIN and the VSS in order to stabilize input power source.

OUTPUT VOLTAGE	CIN	CL (TANTALUM)	CL (LOW ESR)
1.3V~1.6V	More Than $1.0\ \mu\text{F}$	More Than $2.2\ \mu\text{F}$	—
1.7V~6.0V	More Than $1.0\ \mu\text{F}$	More Than $1.0\ \mu\text{F}$	More Than $0.1\ \mu\text{F}$

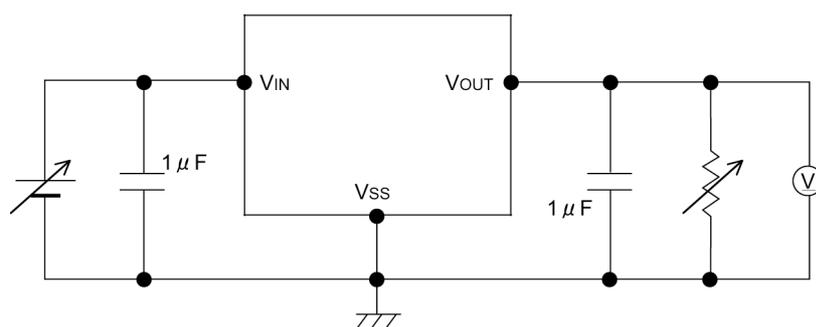

■ TEST CIRCUITS

Circuit ① : Supply Current

Circuit ② : Output Voltage, Oscillation, Line Regulation, Dropout Voltage, Load Regulation

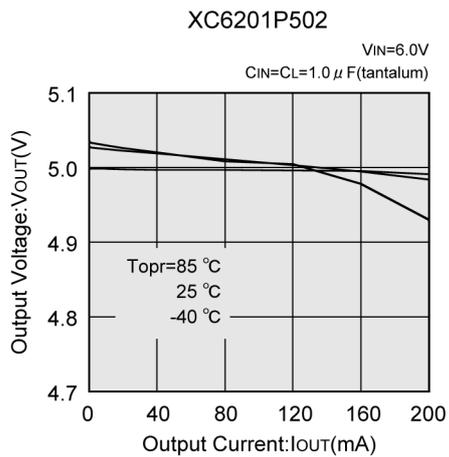

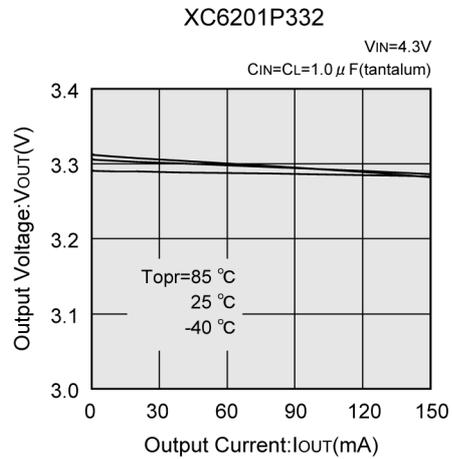

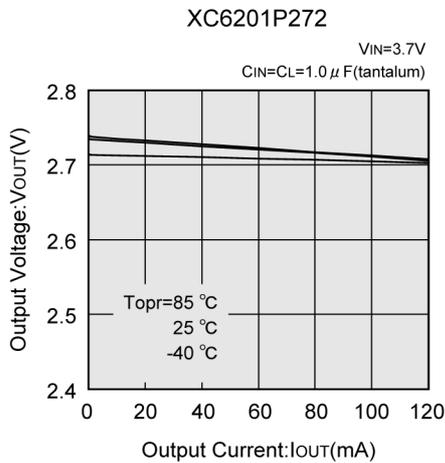

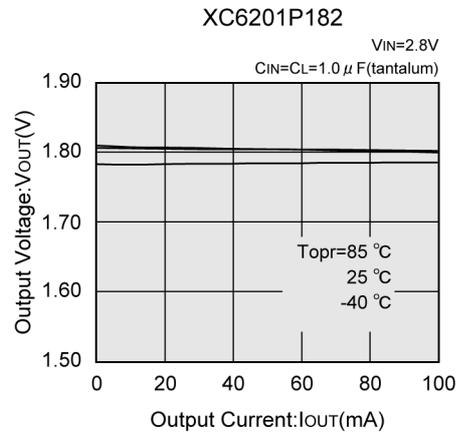

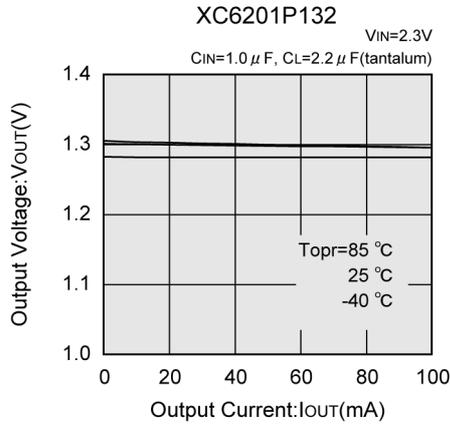

■ NOTE ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded. When a voltage higher than the V_{IN} flows to the V_{OUT} like when using two power supplies, please connect a Schottky barrier diode between the V_{OUT} and the V_{IN} and do not exceed the V_{OUT} rating.
2. An oscillation may occur by the impedance between a power supply and the input of the IC. Where the impedance is 10Ω or more, please use an input capacitor (C_{IN}) of at least $1\mu F$. In case of high output current, operation can be stabilized by increasing the input capacitor value. Also an oscillation may occur if the input capacitor value is smaller than the input impedance when the output capacitance (C_L) is large. In such cases, operations can be stabilized by either increasing the input capacitor value or reducing the output capacitor value.
3. Please ensure that output current (I_{OUT}) is less than $P_d / (V_{IN} - V_{OUT})$ and do not exceed the rated power dissipation value (P_d) of the package.
